The Author believes that in the foregoing examples, by following out in detail each polygon, and connecting the skeleton trusses with them by the notation adopted, he has, if not adding anything new to the graphic theory itself, helped to make it more intelligible to those who wish to understand its practical use. The Paper is illustrated by several diagrams, from which Plates 8 and 9 have been prepared. Paper No. 1918.) Continuous Girder Bridges. By Thomas Claxton Fidler, M. Inst. C.E. In applying mathematical theory to the solution of the various questions which arise in the work of designing iron bridges, it is a matter of no small importance to select such a method of calculation as will exhibit within the smallest possible compass the whole conditions of the problem and process of its solution, and will at the same time present the required results in a simple and manageable form. In these respects, the advantages offered by the Graphic or Geometric methods are very great, although perhaps the facility of adaptation which these methods possess may not be so readily appreciated by the mathematician as they are by the engineer or draughtsman who employs them as instruments in working out the elements and details of his design. In the case, especially, of Continuous Girder Bridges, the formulas deduced by analytical theory are so complex that any simple geometrical solution of the...
